Ch 28 - Worksheet

Find energy levels for hydrogen:

$$E = \frac{-13.6 \text{ eV}}{n^2} \text{ for } n=1, 2, 3, \dots$$

$$E_1 = -13.6 \text{ eV}$$

$$E_2 = -3.4 \text{ eV}$$

$$E_3 = -1.51 \text{ eV}$$

$$E_4 = -0.85 \text{ eV}$$

$$n=4 \text{ ————— } -0.85 \text{ eV}$$

$$n=3 \text{ ————— } -1.51 \text{ eV}$$

$$n=2 \text{ ————— } -3.4 \text{ eV}$$

$$n=1 \text{ ————— } -13.6 \text{ eV}$$

For all series, longest λ corresponds to smallest ΔE

a) For Balmer series, e^- falls to $n=2$

$$\text{Smallest } \Delta E = E_3 \text{ to } E_2 = (-3.4 \text{ eV}) - (-1.51 \text{ eV})$$

$$\Delta E = 1.89 \text{ eV}$$

$$E = \frac{h \cdot c}{\lambda} \quad 1.89 \text{ eV} = \frac{1240 \text{ eV} \cdot \text{nm}}{\lambda}$$

$$\lambda = 656 \text{ nm}$$

b) For Lyman series, e^- falls to $n=1$

$$\text{Smallest } \Delta E = E_2 \text{ to } E_1 = (-3.4 \text{ eV}) - (-13.6 \text{ eV})$$

$$\Delta E = 10.2 \text{ eV}$$

$$E = \frac{h \cdot c}{\lambda} \quad 10.2 \text{ eV} = \frac{1240 \text{ eV} \cdot \text{nm}}{\lambda}$$

$$\lambda = 122 \text{ nm}$$
